Terragrunt Commands

Terragrunt Documentation

- Documentation
- Execute Terraform commands on multiple modules at once
- Configuration Blocks and Attributes

Terragrunt Commands

- When running a terragrunt apply, what is the difference between terragrunt apply `-auto-approve` vs `terragrunt apply --terragrunt-non-interactive`?
- `-auto-approve` skips interactive prompts from Terraform, such as the prompt to check the plan output before running apply. `--terragrunt-non-interactive` skips interactive prompts from Terragrunt, such as the prompt to create an S3 bucket as a state backend if the bucket doesn't exist already.

From each Module

```
terragrunt init
terragrunt plan
terragrunt apply
terragrunt destroy
terragrunt apply --terragrunt-non-interactive
terragrunt destroy --terragrunt-non-interactive
```

From a root module

```
terragrunt plan-all
terragrunt apply-all
terragrunt destroy-all
terragrunt apply-all --terragrunt-non-interactive
terragrunt destroy-all --terragrunt-non-interactive
```
